PROFESSIONAL SUMMARY

DevOps Engineer experienced in designing and shipping fully automated CI/CD pipelines on Google Cloud Platform (GCP) — connecting GitHub, Cloud Build, Trivy security scanning, and Artifact Registry to deploy Dockerized applications onto Compute Engine VMs with zero manual intervention. Built reusable Terraform modules that provision GCP infrastructure in minutes instead of days, and deployed highly available microservices on Kubernetes with Ingress, ConfigMaps, Secrets, and Horizontal Pod Autoscaling. Reduced incident detection time by 50% through a Prometheus, Grafana, and Alertmanager observability stack, while enforcing code and container security gates with SonarQube and Trivy on every release. Confident troubleshooting IAM, networking, and deployment issues to keep releases fast, secure, and reliable.

TECHNICAL SKILLS

Cloud (GCP): Google Cloud Platform, Compute Engine, Google Kubernetes Engine (GKE), Cloud Build, Cloud Run, Artifact Registry, Secret Manager, IAM, VPC, Cloud Monitoring, Cloud Logging

Infrastructure as Code: Terraform

Containers & Orchestration: Docker, Kubernetes, Helm

CI/CD: Google Cloud Build, GitHub Actions, Jenkins

Version Control: Git, GitHub

Operating Systems & Scripting: Linux (Ubuntu), Bash Scripting

Code Quality & Security: SonarQube, Trivy

Monitoring & Observability: Prometheus, Grafana, Alertmanager

Web & Databases: Nginx, PostgreSQL

Networking: TCP/IP, DNS, HTTP/HTTPS, SSH, SSL/TLS, OSI Model, VPC, Subnets, CIDR, Routing, Firewall Rules, NAT, Load Balancing, Reverse Proxy (Nginx), Ports & Protocols, Kubernetes Networking (Services, Ingress), Network Security

Development Tools: VS Code, Postman

PROFESSIONAL EXPERIENCE

DevOps Engineer | Blue Cloud Softech Solutions

Apr 2026 – Present

- Architected end-to-end CI/CD pipelines for 5+ applications using GitHub Actions and Jenkins, cutting average deployment cycle time by 40%.
- Automated infrastructure provisioning on GCP using reusable Terraform modules, reducing environment setup time from 2 days to under 30 minutes.
- Managed production microservices across Kubernetes clusters, configuring Deployments, Services, Ingress, ConfigMaps, Secrets, and Persistent Volumes to achieve 99.9% uptime.
- Oversaw the full container lifecycle — build, scan, push, and promote Docker images across development, staging, and production Artifact Registry repositories — eliminating critical CVEs before release.
- Established an observability stack with Prometheus alerting rules and Grafana dashboards, reducing mean time to detection (MTTD) for incidents by 50%.
- Diagnosed and resolved production incidents affecting 3+ services, improving deployment reliability by 35%.
- Enforced security best practices across all pipelines, including OWASP guidelines, Trivy vulnerability scanning, and IAM least-privilege policies, achieving zero critical security findings in quarterly audits.

DevOps Engineer Intern | Blue Cloud Softech Solutions

Sep 2025 – Mar 2026

- Built CI/CD pipelines using GitHub Actions and Jenkins, automating build, test, and deployment workflows across 3+ environments and cutting manual release effort by 60%.
- Maintained source code repositories and applied GitFlow branching strategy, streamlining collaborative development for a 5-person engineering team.
- Embedded SonarQube and Trivy into CI pipelines to enforce code quality gates and container security standards on every pull request.
- Published Docker images to Docker Hub, supporting Kubernetes deployments and rolling updates across 3+ microservices.
- Supported GCP infrastructure operations, provisioning Compute Engine instances, Cloud Storage buckets, VPC networking, and IAM roles under senior engineer guidance.

- Built Prometheus and Grafana dashboards to monitor 10+ infrastructure and application metrics, enabling proactive incident detection.

PROJECTS

End-to-End CI/CD Deployment Pipeline on Google Cloud Platform | Live: <http://35.244.52.86:8000>

- Designed and implemented a fully automated CI/CD pipeline deploying a Dockerized application from GitHub to a Compute Engine VM using Cloud Build, Artifact Registry, and a custom deployment script.
- Configured a Cloud Build trigger on the main branch to automatically run tests, execute a Trivy security scan, build the Docker image, and push it to Artifact Registry on every push.
- Authored a `deploy-container.sh` script to authenticate Docker, pull the latest image, stop and remove the old container, and start the new container on the VM with zero manual intervention.
- Granted Artifact Registry Reader IAM role to the VM's service account and opened a VPC firewall rule, enabling secure image pulls and public application access on port 8000.
- Resolved 6 distinct deployment issues — including permission errors, IAM authentication scopes, repository misconfiguration, and port mismatches — achieving a 100% success rate on subsequent deployments.

Kubernetes Application Deployment on GKE | Live: <http://34.93.104.243:80>

- Deployed the same CI/CD-driven Dockerized application to Google Kubernetes Engine (GKE), extending the Compute Engine pipeline to a managed Kubernetes cluster.
- Deployed 3+ production-grade microservices on Kubernetes with multi-replica Deployments, ensuring high availability and automatic failover across nodes.
- Configured Ingress controllers, ClusterIP Services, ConfigMaps, and Kubernetes Secrets to securely manage routing, configuration, and sensitive credentials.
- Rolled out Horizontal Pod Autoscaling (HPA) and zero-downtime update strategies, supporting 3x traffic spikes without service interruption.
- Exposed the application externally on port 80 via a LoadBalancer/Ingress Service on GKE, making it publicly accessible.

CI/CD Pipeline with Multi-Environment Testing

- Built a multi-stage pipeline with Google Cloud Build, GitHub Actions, and Jenkins spanning build, automated testing, security scanning, containerization, and deployment across 3 environments, cutting release time by 50%.
- Integrated static code analysis and container vulnerability gates directly into pull requests, blocking merges on any critical finding.
- Standardized Docker image tagging and versioning conventions across the registry, reducing rollback time to under 5 minutes when a bad release shipped.
- Instrumented pipeline stages and application health checks with custom metrics, feeding a shared team dashboard for release visibility.

CERTIFICATIONS

Networking Basics — Cisco Networking Academy (Aug 2026)

EDUCATION

Bachelor of Technology (B.Tech) — 2025

Avanthi Institute of Engineering and Technology, Hyderabad
